Build It – Don't Buy It

Create custom standards-aligned activities and games for your classroom instead of buying materials that almost work for your students. Teachers of all subjects will walk away with custom artifacts ready to implement the next day, and an understanding of how to repeat the process for anything that they can imagine.

Creation of Resource

Step 1: Locate reference material needed for activity. PDFs, PNGs, Word documents, or Excel spreadsheets work best. Links to website may be provided, but they are not as reliable.

Step 2: Select the AI of your choice (Personal vs Professional)

Step 3: Login to the AI to enable chat history

Step 4: Edit prompt template

> **Role:** You are an expert front-end developer and secondary instructional designer.
> **Task:** Create a highly engaging, interactive web game/activity for high school students studying **[SUBJECT]**, focusing specifically on **[CONCEPT]**.
> **Technical Constraints:**
> **1. Single-File Output:** The entire application must be contained within a single index.html file.
> **2. No Local Assets:** All CSS and JavaScript must be written inline within the <style> and <script> tags. Do not reference any local external files, images, or modules. Generate procedural graphics using the Canvas API or SVG if visuals are needed.
> **3. Allowed Libraries:** You may use public CDNs for styling and functionality (e.g., Tailwind CSS, FontAwesome, Tone.js).
> **4. Design & Tone:** The UI must be modern, responsive, and avoid looking overly childish. Integrate clear gamification mechanics like score tracking, visual feedback for correct/incorrect answers, and simple animations.
> **Context:** I have provided reference files. Base the academic content and game mechanics strictly on this provided material.

Step 5: Upload resource files and begin concept creation

Test & Iterate

(If download is not an option, follow this step)

Step 1: Open TextEdit on your MacBook

Step 2: Select TextEdit in the upper left-hand corner and select settings

Step 3: Change the option in the settings popup from Rich Text to Plain Text

Step 4: Close the settings popup

Step 5: Highlight all the HTML code provided to you by your AI (command + A)

Step 6: Copy the highlighted code (command + C)

Step 7: Paste the code into a new document in TextEdit (command + V)

Step 8: Save the TextEdit file onto your desktop as index.html

Step 9: Acknowledge that you received a warning of the extension to .html

(Once downloaded)

Step 10: Double click the file on the desktop to open in your default browser

Step 11: Note any issues encountered when testing or changes that need to be made

Step 12: Inform the AI of issues and wait to regenerate HTML code.

Step 13: Complete Test & Iterate section repeatedly until code is finalized.

Launch or Host

Step 1: Organize the file by name or by nested folder

(Teacher Demo ONLY)

Step 2: Double-clicking the file from within the folder opens it in your default browser

(Student Interaction)

Step 3: Attach the file to an assignment or include it as a resource within Schoology

Step 4: Students must download the file to their computer FIRST

Step 5: Once downloaded, students double-click the file to open in their default browser
